**Subject: Odor Scrubbers at City of San Diego Point Loma
Wastewater Treatment Plant**

Dear Malki:

During the City's Headworks, Odor Control, and Grit Processing Facilities Project, I worked very closely with Daniel Mechanical throughout the procurement, installation, start-up, performance testing, and commissioning stages for two 56,000 cfm odor scrubbing units. The two units were engineered to treat foul air from the headworks using caustic and sodium hypochlorite. Daniel Mechanical not only supplied the scrubbing vessels but also several hundred feet of large diameter foul air duct, pumps, controls, and other appurtenances.

I recently spoke to a Point Loma Plant operations engineer regarding the performance of the odor scrubbers. He informed me that the City was very pleased with the operation of the odor scrubbers. The new units are meeting the performance standard of 99 percent removal of hydrogen sulfide.

I want to express my thanks to you and Daniel Mechanical for your efforts in making the installation of the new odor scrubbers a success. Throughout the design, procurement, installation, testing, and start-up of the units, Daniel Mechanical staff was very responsive to my questions and provided many innovative solutions to save time and budget.

Sincerely,

BLACK & VEATCH

Jonathan C. Hay
